I was born in the year 2004 and in the decade that includes this year, there were a variety of significant events regarding computer technology innovation. In 2001, Apple introduced the iPod, a portable MP3 and media player that could hold up to 10,000 songs. I have memories growing up of listening to music on my dad's old iPod which fostered my love of classic rock I have today. In 2003, the major company Tesla was founded, and Apple opened the iTunes store for users to download and purchase songs from. In 2005, Apple announced they would switch to Intel processors for their technology which led to a variety of advancements for the iPhone. Youtube was also created. In 2007, AMD introduced Quad-Core enabling four complete processing units to run in parallel on one chip. Apple also came out with the IOS operating system on their devices. In 2008, Apple launched the App Store and Google released the first version of the Chrome web browser. All of these advancements in the computer technology field were extremely significant in progressing how far we've come in terms of technology.
